

Product Requirements Document — Test Login Flow

1. Overview

This document specifies the **login flow** for the Practice Test Automation login page. It covers a single, self-contained feature: a user entering credentials and being either logged in or shown a specific error.

- **Feature under test:** Login
- **Page URL:** <https://practicetestautomation.com/practice-test-login/>
- **Scope:** This PRD intentionally covers **ONLY** the login flow — nothing else on the site. It is written to drive a single, complete assurance loop.

2. Published credentials

The valid credentials for a successful login are:

- **Username:** `student`
- **Password:** `Password123`

Any other username or password combination is invalid.

3. Page elements

The login page contains:

- A **Username** input field.
- A **Password** input field.
- A **Submit** button.
- An **error message** area that is shown only when login fails.

4. Requirements

R1 — Successful login with valid credentials

When a user enters the username `student` and the password `Password123` and presses **Submit**, the system **MUST** log the user in:

- The browser **MUST** navigate to a URL containing `practicetestautomation.com/logged-in-successful`
- The resulting page **MUST** contain confirmation text — either “Congratulations” or “successfully logged in”.
- A **Log out** button **MUST** be displayed on the resulting page.

R2 — Invalid username is rejected

When a user enters a username that is not `student` (for example `incorrectUser`) with any password and presses **Submit**, the system **MUST** reject the login:

- An error message **MUST** be displayed.

- The error message text MUST be exactly: **Your username is invalid!**
- The user MUST remain on the login page (no navigation to the success page).

R3 — Invalid password is rejected

When a user enters the valid username **student** but an incorrect password (for example **incorrectPassword**) and presses **Submit**, the system MUST reject the login:

- An error message MUST be displayed.
- The error message text MUST be exactly: **Your password is invalid!**
- The user MUST remain on the login page (no navigation to the success page).

5. Acceptance summary

The login flow is considered correct when all three requirements hold:

1. Valid credentials → user reaches the success page with a Log out button.
2. Invalid username → “Your username is invalid!” error, stays on login page.
3. Valid username + invalid password → “Your password is invalid!” error, stays on login page.

6. Out of scope

The following are explicitly NOT part of this flow and MUST NOT be tested here:

- Any other page on the site (Practice, Courses, Blog, Contact, etc.).
- “Remember me”, password reset, sign-up, or social login (these do not exist on this page).
- Field-level validation styling, placeholder text, or visual layout.
